THINGS NOT YET IMPLEMENTED

✓ IN BINNING PUT FALLBACK ON $\sqrt{N}$ or smthg like that if no knee found

- Check what is the fallback if no knee
- KDE bandwidth choice (also for comparability!) to be tuned and... binning why so bad if bin size choosen to match Ground truth?

- Why in KDE bootstrapping and in the others not?
  [BOOTSTRAPPING I'd say in all or in none]

✓ ROUGH GAUSSIAN METHOD (no copula) to be re-inserted and analyzed for varying N and σ

- AUTO-REG & MAG (?) if we must !!

⇒ · SYSTEMATIC COMPARISON BTW METHODS

(update notes when done)
